

Hands-on Lab 2: Photo Forensics , Jordan Jackson

1. Use Google Maps satellite view to compare the location with the photo

Example pulled from Google Maps

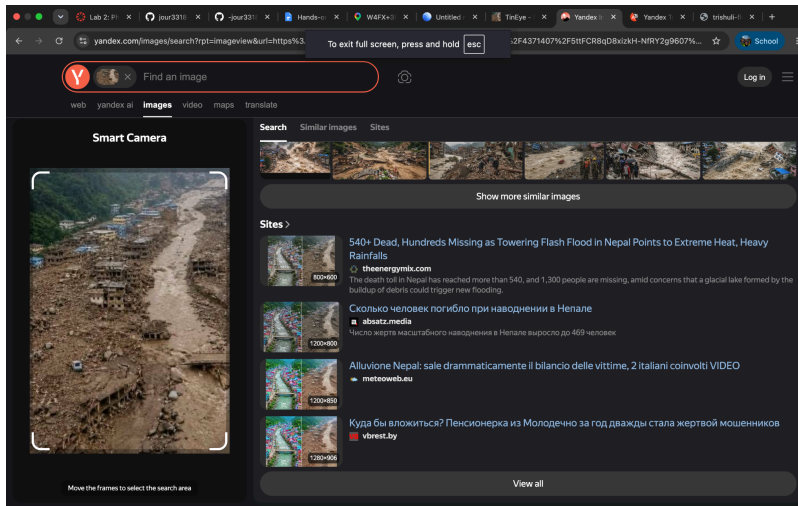

Example pulled from Google Earth

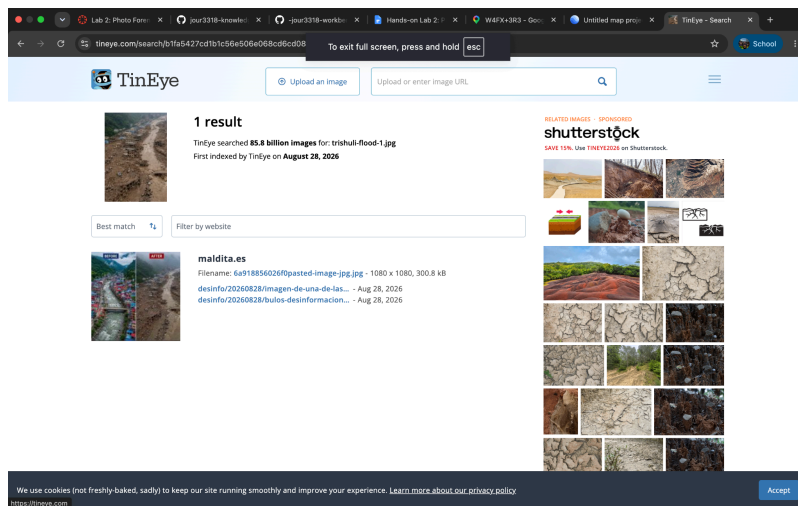

After looking at both an example from google earth and Google Maps I am already questioning how real the photo shares across the world truly is. The Photo seems to feature both a bridge and what looks like a river or large mass of water . But in the satellite image from both google maps and google earth , it is hard to find anything in the area that looks like a body of water. The other strange factor is that in both of the examples I was able to find all of the buildings seem like they have never been harmed. While the photo going around the world seems to show images similar

to the aftermath of Hurricane Katrian. So I definitely have more questions about the image after looking at the satellite view!

2. Use a tool (RevEye browser extension, TinEye, Yandex, Google Lens) to find the source of the photo

What I found from [Yandex.com](https://yandex.com)

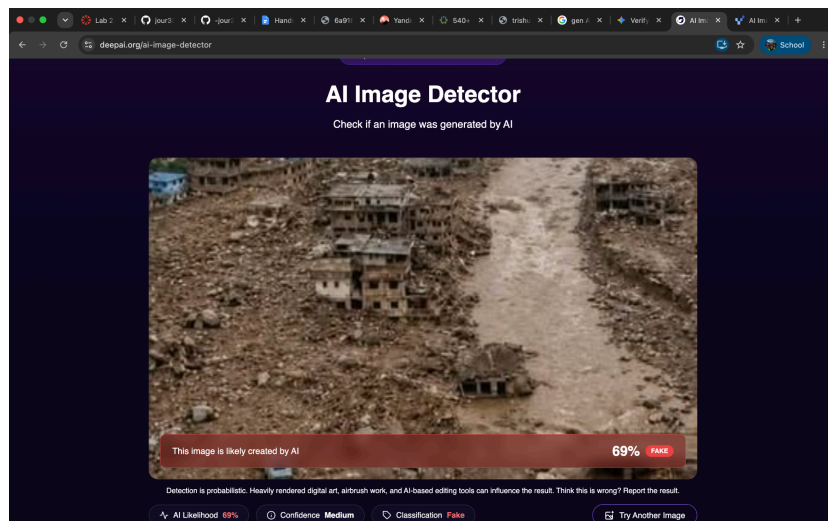

What I found from [Tineye.com](https://tineye.com)

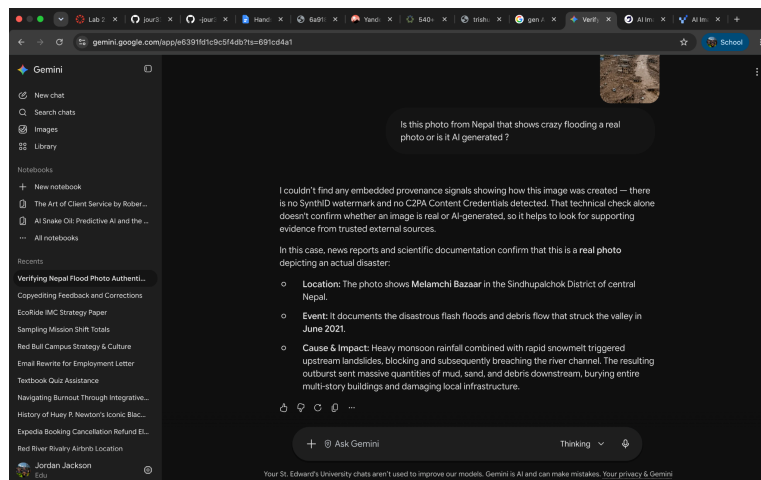

I decided to use 2 different tools to find the origins of this image. By using both [Tineye.com](https://tineye.com) and [Yandex.com](https://yandex.com) I was able to find interesting results. [Tineye.com](https://tineye.com) gave me results that led me to the before and after photo that was attached to a news article about the matter.

Yandex.com did the same thing, but was able to be there for multiple sources that were talking about the tragedy that happened. Even with quotes from people who witness the disaster in person. So now I'm even more confused on whether the photo is real or AI generated

3. Use genAI to check for AI

What I found from <https://deepai.org/>

What I found from <https://gemini.google.com>

After using both Google Gemini and deepai.org I am starting to feel like the photo is for sure AI or fabricated in some way. My personal theory that the photo is real and may have been edited

with AI to look like the floods did more damage than was actually done. deepai.org says that there is a 70 percent chance that the photo is AI generated. While Gemini was unable to tell me a straight answer or give me the exact origin of the photo.
